

TravelTrust Whitepaper

TravelTrust is a decentralized travel-commerce protocol. Travelers lock trip deposits in USDC escrow. TTG is for governance and Region Steward seats, not the default settlement asset for orders. Addresses follow the Official Protocol page. Send funds only to addresses listed here.

General information only. This is not an offer of securities or virtual assets in any jurisdiction, and not investment, tax, or legal advice. Terms of service and executed agreements control.

0 · What is true now

Trip deposits can lock in escrow under the protocol. Exchanging TTG is separate, and the window is not open to the public. Governance changes wait 12 hours. There is no written production go-live.

Fact	Now
Protocol deployed on Ethereum mainnet	Yes
Public-sale window open to the public	No
Written production go-live	No

1 · What the protocol does

The protocol splits a travel sale into checkable on-chain paths:

- Marketplace: discovery and matching
- Escrow: milestone lock and release of traveler principal (USDC on mainnet)
- Platform fee: 5% on verified trips, split by country
- Region Steward: stake TTG for a seat and share that country's real platform fees — not minted rewards
- Governance: sale, vault, and parameter changes wait 12 hours

Merchants and guides do not stake TTG by default. Their performance uses order-side bonds, separate from steward seats.

2 · Region Steward: a different staking model

Many tokens use lock-and-emit staking to dampen sell pressure: depositors earn a low APR, often paid by inflation. TravelTrust does not.

Applying as a country's Region Steward is the stake: TTG locks to the country threshold. Steward income comes from travel that already happened in that country — 45% of the platform fee to the steward's registered wallet, 55% to the project pool (the split can be negotiated with the team and community, and reconfigured by governance proposal). With no seated steward, 100% of the platform fee goes to the pool.

TTG cannot mint after genesis, so steward pay cannot be printed as new tokens. The seat threshold is live supply $\times$ country bps / 10000, and it falls when supply is burned. A 300,000 USDC access fee goes to the operations wallet and is counted separately from the stake. It pays the founding team's start-up costs: protocol development, security and infrastructure, early operations, and payroll. It is not a stake and does not count toward the seat threshold.

That does two jobs at once: TTG is locked in a governance seat, and the staker shares real regional flow instead of a low APR unrelated to sales.

Initial ten-country bps: CN/US 400 · FR/ES 450 · JP/TH 250 · SG/KR 200 · AU/AE 150. The seat-contract upgrade is still waiting on the 12-hour delay. The fee split is already in the fee rules.

3 · Monetary rules

Rule	Meaning
Genesis supply	25,000,000,000,000 TTG (25T)
Minting	No further mint after genesis
Supply decrease	Governance burn only: vote → 12-hour delay → authorized burner
Token body	Non-proxy; monetary rules live in the token
Upgrades	Periphery may upgrade via governance; upgrades must not bypass the no-mint rule

4 · Genesis allocation (50 / 35 / 3 / 5 / 7)

Bucket	Share	Amount	Destination
Public sale vault	50%	12.5T	PublicSaleVault
Governance treasury / 12-hour delay	35%	8.75T	12-hour delay contract
Team	3%	0.75T	0x010365F0835323826569D61D0E13E6F8d25F6828
Marketing	5%	1.25T	0xe1e732EfBf9B010a9204054467256d3d93f3CdD4
Treasury / ops	7%	1.75T	0xF34804AA66bAeE02F3aF1C54

Bucket	Share	Amount	Destination
			0B9997C7F46b2736

0xe1e732...CdD4 is also the deployer and 12-hour-delay admin. 0xF34804...2736 is also the pause key, access-fee recipient, and ops-spend recipient.

5 · Public exchange (five batches)

Primary sales run through the batch market and public-sale vault. The window is not open to the public. Caps are absolute:

Batch	Cap (TTG)	USDC per 1 TTG (6-decimal raw)
1	1.25B	1
2	3.75B	3
3	18.75B	5
4	168.75B	7
5	2,025B	9

Batch writes and price changes go through a governance vote and the 12-hour delay. Treasury cannot change prices from an ordinary wallet. Sale USDC goes to the project pool.

6 · Platform fee and country split

Rule	Meaning
Platform fee rate	500 bps (5%), governance-only change
Seated steward	45% to the steward registered wallet, 55% to the project pool (negotiable with team and community; reconfigurable by governance proposal)
No steward	100% to the project pool
Country key	Escrow orders carry an ISO country code

Fees come only from verified escrow / settlement paths. There is no separate holder dividend.

7 · Merchants, guides, and the access fee

Role	TTG stake	Performance
Region Steward	Active; see section 2	Seat plus country platform-fee share
Merchant	Not required	Bond rules independent and

Role	TTG stake	Performance
		unconfirmed
Guide	Not required	Per-order USDC performance bond

The Region Steward access fee is 300,000 USDC to `0xF34804AA66bAeE02F3aF1C540B9997C7F46b2736`. It funds the founding team's start-up costs: protocol development, security and infrastructure, early operations, and payroll. It is separate from the TTG seat stake and is not refundable in the ordinary course.

8 · Project pool

The project pool collects sale USDC and platform-fee shares routed to the pool. Ops spend: propose → 12-hour delay → `0xF34804AA66bAeE02F3aF1C540B9997C7F46b2736`. Cumulative spend in any 90-day window is at most 30%.

9 · Governance delay

Governor → 12-hour delay (`0xF61880fe9943BBc624F487782E2fB35d8Ae50E3A`)
 Scheduler is an operations wallet
`0xe1e732EfBf9B010a9204054467256d3d93f3CdD4`
 (not a contract, not treasury)
 └─ Market / Vault / Fee / Stake / Pool
 └─ Governance burn authorization

No multi-sig administers the 12-hour delay. Send funds only to addresses listed on this page.

Trip money path: escrow factory 0xEE0BE3a8a8658E06c44539deD758Fb70A7f3C1C6 · settlement router 0xe5C3ED16741Eb195fAE11b0C1449A79DD675B372 · USDC 0xA0b86991c6218b36c1d19D4a2e9Eb0cE3606eB48.

11 · Security, scope, and risk

No mint after genesis. Holders cannot burn. Governance burn waits 12 hours. Platform fee starts at 5%. Pool ops spend is capped at 30% in any 90-day window. This document states living rules and checkable addresses. It does not rewrite the website or observer layer, and it does not issue go-live.

Cutover is still incomplete: batches may be unseeded, fees may not yet point to the new router, and the seat implementation is queued. Regulatory, tax, and jurisdictional access are separate. Production GO remains NO_GO.

Key points

- Trip deposits use USDC escrow. TTG is for governance and seats; the exchange window is not open.
- Region Steward staking locks TTG; yield is that country's real platform fee (living 45/55, reconfigurable by governance proposal), not inflation rewards. The 300,000 USDC access fee is a start-up cost, not a stake.
- Genesis split 50 / 35 / 3 / 5 / 7; 25 trillion supply; no mint.
- Governance waits 12 hours. Stations 14 and 15 are person keys, not contracts.
- This page is not a securities offering and does not issue a written production go-live.
